Abstract: The paper presents a model for determining more precisely the axial resonance frequency in cylindrical resonant cavity. It is known that resonance frequencies on axial direction of the electric field in cylindrical resonant cavity are determined by null points of the Bessel function $J_0$ but, in practical experiments be noticed a shift in positive direction of the real resonance frequency compared to that calculated. Just this correction is made in this paper.

Keywords: electromagnetic field, distribution, Bessel.

1. INTRODUCTION

To calculate the resonance frequencies in cylindrical and elliptical cavities, it requires a full analysis of electromagnetic (EM) phenomena that happen in this volume. In addition to the Bessel function for field oscillation, the paper presents the analytical field distribution function in opening cavity radius, phenomena taking place simultaneously.

The paper is structured in three parts: deduction of distribution function of electromagnetic field, attaching the $J_0$ Bessel distribution function, conclusions on the result obtained.

2. DEDUCTION OF DISTRIBUTION FUNCTION OF EM FIELD

For deduction of the distribution function of EM field, is used drawing in FIG. 1 and Maxwell’s equations for dynamic field.

FIG. 1. Schematic representation of the oscillation phenomenon of cavity
The Resonance Frequency Correction in Cylindrical Cavities in Axial Direction

\[ c^2 \cdot \nabla \times B = \frac{\partial E}{\partial t} \]  
(1)

\[ \nabla \times E = -\frac{\partial B}{\partial t} \]  
(2)

=>

\[ c^2 \oint_{\Gamma_1} B \, dl = \frac{\partial}{\partial t} \int_{\Sigma \Gamma_1} E \, ds_1 \]  
(3)

\[ \oint_{\Gamma_1} E \, dh = -\frac{\partial}{\partial t} \int_{\Sigma \Gamma_1} B \, ds_2 \]  
(4)

\[ ds_1 = 2\pi r \cdot dr \]

(I) The first iteration

\[ c^2 \cdot 2\pi r \cdot B_1 = E_0 e^{j\omega t} \cdot j\omega \int_{\Sigma \Gamma_1} 2\pi r \, dr \]  
(5)

\[ B_1 = \frac{j\omega}{2c^2} E_0 e^{j\omega t} \cdot \tau \]  
(6)

Writing relation (4) for the contour \( \Gamma_1 \), is obtained:

\[ \oint_{\Gamma_1} E_1 \, dl = -\frac{\partial}{\partial t} \int_{\Sigma \Gamma_1} B_1 \, ds_2 \]  
(7)

\[ ds_2 = r \cdot dh \]

Solving integrals, equation (7) becomes:

\[ -hE_1 = -\frac{\partial}{\partial t} \left( E_0 e^{j\omega t} \cdot \frac{j\omega}{c^2} \right) \frac{r^2}{2} h \]  
(8)

After derivation, follow:

\[ -E_1 = E_0 e^{j\omega t} \cdot \frac{\omega^2 r^2}{2c^2} \]  
(9)

\[ E_1 = -E_0 e^{j\omega t} \cdot \frac{\omega^2}{2c^2} \cdot r^2 \]  
(10)

(II) The second iteration

\[ c^2 \cdot 2\pi r \cdot B_2 = \frac{\partial}{\partial t} \int_{\Sigma \Gamma_1} E_1 \, ds_1 \]  
(11)
\[ c^2 \cdot 2\pi r B_2 = -\frac{j\omega^3}{c^2} E_0 e^{j\omega t} \int r^2 \cdot 2\pi r \, dr \]  
(12)

\[ B_2 = -\frac{j\omega^3}{2 \cdot 4 \cdot c^4} E_0 e^{j\omega t} \cdot r^3 \]  
(13)

\[ \oint_{\Gamma_n} E_2 \, dl = -\frac{\partial}{\partial t} \oint_{\Sigma_{\Gamma_n}} B_2 \, ds_2 \]  
(14)

=>

\[ E_2 = \frac{\omega^4}{2 \cdot 4 \cdot c^4} E_0 e^{j\omega t} \cdot r^4 \]  
(15)

(III) The third iteration

\[ c^2 \cdot 2\pi r B_3 = \frac{\partial}{\partial t} \oint_{\Sigma_{\Gamma_n}} E_2 \, ds_2 \]  
(16)

=>

\[ B_3 = \frac{j\omega^5}{2 \cdot 4 \cdot 6 \cdot c^6} E_0 e^{j\omega t} \cdot r^5 \]  
(17)

\[ \oint_{\Gamma_n} E_3 \, dl = -\frac{\partial}{\partial t} \oint_{\Sigma_{\Gamma_n}} B_3 \, ds_2 \]  
(18)

=>

\[ E_3 = \frac{\omega^6}{2 \cdot 4 \cdot 6 \cdot c^6} E_0 e^{j\omega t} \cdot r^6 \]  
(19)

If it continues, is obtained the overall intensity of the electric field \( E_T \) as an expression of the form:

\[ E_T = E_0 e^{j\omega t} \left[ 1 - \frac{1}{2} \left( \frac{\omega r}{c} \right)^2 + \frac{1}{2^2 \cdot 2!} \left( \frac{\omega r}{c} \right)^4 - \frac{1}{2^3 \cdot 3!} \left( \frac{\omega r}{c} \right)^6 + \ldots \right] \]  
(20)

If we denote \( \frac{\omega r}{c} = x \), we get the expression:

\[ E_T = E_0 e^{j\omega t} \left( 1 - \frac{1}{2} \frac{1}{1!} x^2 + \frac{1}{2^2 \cdot 2!} x^4 - \frac{1}{2^3 \cdot 3!} x^6 + \ldots \right) \]  
(21)
This relation can be written as:

$$E_r = E_0 e^{j\omega t} \left[ 1 + \frac{1}{2} \sum \frac{x^{2i}}{i!} (-1)^i \right]$$  \hspace{1cm} (22)

This is the series expansion of the function:

$$E_r = E_0 e^{j\omega t} e^{-\frac{1}{2}\alpha^2}$$  \hspace{1cm} (23)

Or,

$$E_r = E_0 e^{j\omega t} e^{-\frac{1}{2}(\frac{\omega r}{c})^2}$$  \hspace{1cm} (24)

This expression represents the global electric field intensity distribution, function of the radius cylindrical resonator:

$$E_r = E_0 e^{j\omega t} \cdot f(r)$$  \hspace{1cm} (25)

In this expression, for a resonance frequency known,

$$f(r) = e^{-\frac{1}{2}(\frac{\omega r}{c})^2}$$  \hspace{1cm} (26)

### 3. ATTACHING THE J₀ BESSEL DISTRIBUTION FUNCTION

If the calculation is repeated with iterations I, II, III... where is considered that

$$ds_1 = 2\pi r \cdot d\tau$$ and $$ds_2 = r \cdot dh$$ (phenomenon development on radius) is obtained the series:

$$E = E_0 e^{j\omega t} \left[ 1 - \frac{1}{(2\pi)^2} \left( \frac{\omega r}{c} \right)^2 - \frac{1}{(4\pi)^2} \left( \frac{\omega r}{c} \right)^4 - \frac{1}{(6\pi)^2} \left( \frac{\omega r}{c} \right)^6 + \cdots \right]$$  \hspace{1cm} (27)
This expression, in restricted form, is:

$$E = E_0 e^{j\omega t} J_0 \left( \frac{\omega r}{c} \right)$$  \hspace{1cm} (28)

$J_0$ is the Bessel function of the first kind and zero order and describes at zero crossings, the frequencies around which is carried out the resonance phenomenon of the cylindrical cavity. In practical measurements it has been observed that the real resonance frequencies are shifted slightly to the right compared to the zero crossings of Bessel function,

$$J_0(X) \Big|_{X=\frac{\omega r}{c}}$$

This frequency deviation, $\Delta f$, results from overlapping the function $E_T$ over the function $E$, the two components of the electric field intensity taking place simultaneously.

$$E_{\text{resultant}} = \frac{E_T + E}{2} = \frac{1}{2} E_0 e^{j\omega t} \left( J_0(X) + e^{-\frac{1}{2}X^2} \right)$$  \hspace{1cm} (29)

Thus, the correction function is:

$$P(X) = J_0(X) + e^{-\frac{1}{2}X^2}$$  \hspace{1cm} (30)

**FIG. 3.** The Bessel function $J_0$.

### 3. CONCLUSIONS

The diagrams in FIG. 2 and FIG. 3 represents the EM field radius distribution, respectively the Bessel function $J_0$, with independent action. In the diagram in FIG. 4, the Bessel function $J_0$ and the correction function $P(X)$ are simultaneously represented. This figure shows the displacement frequency correction (zero-crossing of $P(X)$) compared to Bessel function, in this way:
The first null of Bessel function is \( x = 2.405 \).
The first null of \( P(X) \) function is \( x = 2.47 \).
The second null of Bessel function is \( x = 5.52 \).
The second null of \( P(X) \) function is \( x = 5.543 \).

The resonance frequencies obtained from the correction function \( P(X) \) have better accuracy with an order of magnitude compared to Bessel function.
